## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Bone morphogenetic proteins (BMPs) are naturally occurring proteins found in the human body. This family of proteins is involved in a myriad of cellular responses. Certain BMPs are osteoinductive—one of the three main categories of bone grafts—and play an active role in bone formation and maintenance.

Bone Morphogenetic Protein 2 (BMP-2) is a member of the bone morphogenetic protein family, a group of proteins that play a crucial role in bone and cartilage formation during embryonic development and adult tissue repair. BMP-2 is known for its potent osteoinductive properties, meaning it has the ability to stimulate the differentiation of mesenchymal stem cells into osteoblasts, the cells responsible for bone formation. This property makes BMP-2 a valuable therapeutic agent in orthopedic and dental surgeries, particularly in procedures aimed at promoting bone regeneration and spinal fusion.

The global Bone Morphogenetic Protein (BMP) 2 market size is projected to grow from US\$ 682 million in 2024 to US\$ 1160 million in 2030; it is expected to grow at a CAGR of 9.2% from 2024 to 2030.
