Bone trauma internal fixation nails are medical implants used in orthopedic surgery to stabilize long bone fractures, such as those in the femur or tibia, by being inserted into the bone's central cavity (medullary canal). Made from biocompatible materials like titanium, these nails provide internal support to fractured bones, allowing for controlled healing and alignment while minimizing external fixtures. Internal fixation nails are designed to be strong, lightweight, and durable, helping maintain bone alignment and enabling patients to gradually regain mobility.
