Bone void fillers are the synthetic bone graft substitutes being used as a filler for gaps or voids in the bone structure for maintaining its stability. These defects may be surgically generated osseous defects or any bone defect from a traumatic injury. These are synthetically made and has an osteoconductive component such as hydroxyapatite, and one resorbable component such as calcium sulfate. These bone void fillers are commercially available in various forms such as gel, putty, powder, granules, paste etc. Besides filling a bone defect, these bone void fillers are also used to stimulate new bone growth as well as ensuring the mechanical stability and metabolic functioning at the defect site. Recent years saw an increasing number of synthetic bone substitutes available clinically as a substitutes to the traditional graft materials. But these need to pass the biocompatibility testing as per the ISO guidelines.
