A boom limiting device is a safety control component installed on cranes or construction machinery to restrict the lifting angle, outreach, or working range of the boom. It prevents over-limit operation that may lead to structural instability or safety accidents. The device may utilize mechanical stops, limit switches, or electronic sensor systems to monitor and control boom position, forming a critical part of the lifting safety system.

Upstream includes structural steel materials, angle sensors or limit switches, control modules, and electrical connectors. Downstream applications include tower cranes, truck-mounted cranes, and various construction machinery. The overall industry gross margin generally ranges from 25% to 45%, with higher margins for intelligent electronic control models.

In 2025, the global production of boom limiting devices was 217,000 units, with an average price of US\$4,200 per unit.

United States market for Boom Limiting Device is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
