## Abstracts

The global Booster Pump for CCUS market size is predicted to grow from US\$ 242 million in 2025 to US\$ 415 million in 2032; it is expected to grow at a CAGR of 5.8% from 2026 to 2032.

A booster pump for CCUS (Carbon Capture, Utilization, and Storage) is a high-pressure pump specifically designed to increase the pressure of captured CO<sub>2</sub> gas or liquid during transportation or injection phases of the CCUS process. After carbon is captured, often at relatively low pressures, it must be compressed and transported (via pipeline or truck) to storage sites or utilization facilities. Booster pumps ensure that the CO<sub>2</sub> reaches the required pressure levels (often 100-200 bar or higher) for efficient pipeline flow or geological injection into deep saline aquifers or depleted oil and gas reservoirs. These pumps are engineered to handle the unique properties of CO<sub>2</sub>, such as high compressibility, phase transitions, and corrosion risks, ensuring safe, continuous, and energy-efficient operation within the CCUS infrastructure. The average price of this product is approximately US\$1,700 K per unit, with annual sales of approximately 150 units.

Upstream for a Booster Pump for CCUS mainly involves raw material and component suppliers such as specialty steels and alloys, castings, seals, bearings, and drive systems, along with engineering and manufacturing inputs, while downstream consists of EOR contractors and end users in CCUS projects including long-distance CO<sub>2</sub> pipeline transport operators, carbon storage developers, and enhanced oil recovery operators who integrate and operate the pumps within compression and injection systems.

The market for Booster Pump for CCUSs is positioned for steady growth but remains

highly project-driven and relatively niche within the broader CCUS equipment landscape. Demand is fundamentally tied to the expansion of carbon capture, utilization, and storage infrastructure, which is accelerating globally under decarbonization policies and net-zero targets, with CCUS capacity expected to scale significantly over the next decades. At the same time, only a subset of projects—primarily long-distance pipeline transport and high-pressure injection systems—require multi-stage centrifugal booster pumps, resulting in a concentrated but high-value market characterized by low volumes and large ticket sizes. Technologically complex engineered centrifugal pumps are expected to account for a substantial share of CCS-related pump value as infrastructure matures, reinforcing the importance of this segment. Overall, the market outlook reflects a combination of strong long-term policy-driven growth and short-term volatility linked to project timing, regional infrastructure buildout, and investment cycles.
