The global Borehole GPR market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Borehole GPR is a geophysical technique used to investigate subsurface conditions through boreholes. It involves lowering a GPR antenna into a borehole to emit electromagnetic waves, which reflect off underground features such as geological formations, water tables, fractures, or buried objects. This method is particularly useful for exploring deeper subsurface layers, providing high-resolution imaging in vertical profiles. Borehole GPR is widely applied in environmental studies, hydrogeology, and geotechnical engineering to map underground structures and assess conditions like groundwater flow or soil composition.

United States market for Borehole GPR is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Borehole GPR is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
