Borehole Ground Penetrating Radar is a geophysical technique that involves the use of radar waves transmitted from within a borehole to investigate subsurface structures and properties. By sending high-frequency electromagnetic waves into the surrounding material, BGPR detects reflected signals from different subsurface layers and features, allowing for detailed mapping and analysis of the underground environment. It is particularly useful for applications such as identifying geological formations, fractures, and voids, as well as for environmental, hydrogeological, and engineering investigations.

United States market for Borehole Ground Penetrating Radar is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
