Abstracts

The global Boron Amine Complex market size is predicted to grow from US$ 123 million in 2025 to US$ 212 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

Amine–borane complexes are donor–acceptor complexes formed between BH? and nitrogen-based Lewis bases such as ammonia, alkylamines, arylamines, pyridine and morpholine. These compounds are generally more stable and easier to handle than free borane or borane ether/sulfide complexes, while still serving as useful hydride donors. Key applications include electroless metal plating, selective organic reduction, pharmaceutical and fine-chemical synthesis, boron nitride or boron carbonitride precursor chemistry, and hydrogen-storage research.

Anderson Development describes amine borane complexes as stable borane sources and versatile reducing agents, with applications in polymer, dye, metal plating and pharmaceutical industries.

Amine–borane complexes' value comes from stabilizing highly reactive BH? with ammonia, alkylamines, arylamines, pyridine or morpholine, making the resulting complexes easier to handle, dose and use as reducing agents or material precursors.

From the supply perspective, the market is structured around a small number of specialty boron chemical producers, global catalog reagent suppliers and custom synthesis providers. Boron Specialties is one of the strongest confirmed production-oriented suppliers, with an amine boranes product family and U.S.-made ammonia borane. Anderson Development Company has specialty and custom chemical manufacturing capability and lists ALMABOR® morpholine borane and pyridine borane

products.

Demand is led by DMAB, which is mainly used in electroless nickel–boron plating, electronic surface finishing, metallization and high-performance wear-resistant coatings. Ammonia borane is more closely linked to hydrogen storage, BN/BCN precursor chemistry, propellant-related uses and materials research. Pyridine borane, morpholine borane and trimethylamine borane are mainly used as selective reducing agents in organic synthesis and fine-chemical process development. Future growth should be supported by formaldehyde-free electroless plating systems, electronic metallization, alternatives to hard chrome, BN thin-film and ceramic precursor development, hydrogen-storage research and higher-selectivity reduction processes.
