Boron carbide is one of the hardest artificial abrasives, second only to diamond, with a hardness of 9.36. It has high grinding efficiency and is suitable for machining various hard materials such as hard alloys, gemstones, etc. It is an ideal substitute for diamond. Boron carbide is also a key material in engineering products, refractories, and special welding. It can be made into wear-resistant welding rods, various advanced cutting tools, highly wear-resistant abrasives, sandblasting nozzles, sealing rings, precision measuring components, etc. Boron carbide has a density of 2.52g/cm³ and a melting point of 2450 degrees Celsius. It is resistant to high temperatures and does not react with alkalis. It has neutron absorption and semiconductor conductivity properties, making it an indispensable material for manufacturing boron-containing compounds such as boron titanium, boron steel, and neutron absorbers in nuclear industry.
