The global Boron Flame Retardant market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Boron flame retardant refers to a kind of flame retardant containing boron element in the molecule. Zinc borate is the most widely used. It has good thermal stability and generally does not need surface treatment. It is often used in combination with self-series flame retardants. During combustion, gaseous boron halide and zinc halide are generated, and crystalline water is released. A glass-like protective layer is formed on the surface, which has heat absorption, covering and other flame retardant effects. Suitable for rubber, plastic and paint. Boron is selected as the main flame retardant additive because borate has a strong synergistic effect with other flame retardants, which can effectively improve the performance of the formula. Compared with other additives such as antimony trioxide, borate is a cost-effective and natural choice.

United States market for Boron Flame Retardant is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
