The global Boron Nitride for Electronic Packaging market size is predicted to grow from US\$ 28.66 million in 2025 to US\$ 134 million in 2032; it is expected to grow at a CAGR of 24.7% from 2026 to 2032.

Boron nitride (BN) is an inorganic compound composed of boron and nitrogen elements. Its core crystal structure is hexagonal (h-BN), exhibiting both ultra-high thermal conductivity and excellent insulation properties, making it a key multifunctional filler in the field of electronic packaging. In electronic packaging, boron nitride is processed through physical modification (such as grinding and spheroidization) or chemical modification (such as hydroxylation and surface grafting) to form various morphologies such as spherical, sheet-like, layered, and irregularly shaped forms. These are then integrated into packaging materials (resins, adhesives, films, etc.) or structures to achieve core functions such as thermal conductivity, insulation, and mechanical reinforcement. This results in two main categories: spherical boron nitride and non-spherical boron nitride (sheet-like, angular, etc.).

In terms of price, there is a significant difference between spherical and angular boron nitride. The price of spherical boron nitride powder ranges from \$100 to \$500 per kilogram, with a gross profit margin of around 40%.
