The boundary switch controller is an intelligent control device for boundary switches on medium-voltage distribution lines (usually 10kV or above) in the distribution automation system. It integrates monitoring, protection, control, and communication, and has remote and local operation functions. It collects electrical parameters such as line voltage, current, and zero-sequence current, and combines internally set fault judgment criteria (such as overcurrent, grounding, short circuit, etc.) to achieve automatic detection, judgment, and isolation of faults. It can instruct the boundary switch to quickly open or reclose to avoid the spread of faults, effectively shorten the power outage time, and improve power supply reliability. The device is widely used in urban ring network power supply systems, rural distribution network transformation, ring network cabinet control systems, box-type substations, and switchgear. It is one of the important basic equipment for realizing the intelligence of distribution networks, rapid fault location, and power supply restoration.

United States market for Boundary Switch Controller is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
