A brake lathe is an efficient tool for curing noise and vibration problems, often prolonging the life of brake systems. There are two types of brake lathes. An on-car lathe often does a reliable job, because it's installed in the same position as the brake caliper, basically mimicking the movement of the wheel with regard to the car's calibrations. This provides the most accurate resurfacing possible. For an off-car lathe or bench lathe, the rotor is removed from the car and mounted to the lathe. This type of lathe relies more on its own alignment, which is easily thrown out of spec from damage or frequent use. At best, a misaligned lathe will provide merely acceptable resurfacing; at worst, it might score or damage the rotor beyond the point it can be resurfaced.
