A brake roller is a type of roller equipped with an integrated brake mechanism.

Brake rollers are used in a wide range of applications, such as production lines, where the centrifugal force of the brake shoes built into the roller spreads out to control the speed of sliding. As this force is directly proportional to both the weight of the sliding workpiece and its speed, it allows for smooth control of the sliding motion without the need for electrical power. However, it is crucial to consider the direction of rotation and the height positioning carefully during installation.

The global Brake Roller market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
