The global Branched Alkylphenol market size is predicted to grow from US\$ 1700 million in 2025 to US\$ 2210 million in 2032; it is expected to grow at a CAGR of 3.8% from 2026 to 2032.

Branched Alkylphenol refers to a class of alkyl-substituted phenolic compounds in which the alkyl side chain attached to the phenol ring has a branched carbon structure (commonly C<sub>4</sub>-C<sub>12</sub>), typically produced through the acid-catalyzed alkylation of phenol with branched olefins such as propylene trimers, tetramers, or isobutylene derivatives. The supply chain begins with upstream petrochemical feedstocks, including benzene (from naphtha reforming or steam cracking) used to produce phenol via the cumene process, and branched olefins derived from refinery and petrochemical streams such as propylene oligomers or isobutylene. In the midstream chemical processing stage, phenol undergoes catalytic alkylation to form various branched alkylphenols (e.g., tert-butylphenol, nonylphenol, octylphenol), followed by purification and fractionation. Downstream, branched alkylphenols are used as key intermediates in the production of antioxidants, surfactants (alkylphenol ethoxylates), epoxy resin modifiers, lubricant additives, rubber processing chemicals, coatings, and polymer stabilizers, serving industries such as plastics, detergents, automotive, electronics, and industrial chemicals. In 2025, global Branched Alkylphenol output was about 900,000 tons with 1.4 million tons of capacity, average prices of USD 1,600 - 2,600 per ton, and gross margins around 18%.
