The global Brass Exhaust Valve market size is predicted to grow from US\$ 63.88 million in 2025 to US\$ 90.23 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

In 2025, global sales of Brass Exhaust Valves reached 9.6 million units, with an average selling price of \$6.8 per unit. Brass Exhaust Valves are functional valves used in piping or equipment systems to automatically release gas and prevent airlocks. They are primarily made of brass, which is corrosion-resistant, has good thermal conductivity, and high mechanical strength, and are widely used in HVAC systems, water supply networks, boiler equipment, and underfloor heating systems. Their working principle utilizes a float or spring structure; they automatically open to release air when it accumulates in the system and automatically close when the system is full of liquid, thus ensuring system circulation efficiency and operational stability.

Upstream raw materials mainly include copper (brass), sealing rubber parts, stainless steel springs, and precision-machined components. Downstream suppliers primarily serve construction companies, HVAC equipment manufacturers, water treatment system integrators, and municipal engineering units. Global total production capacity is approximately 12 million units per year, with an average industry gross profit margin of approximately 15%-22%.

The future lies in developing towards high reliability, long lifespan, and intelligent monitoring, such as combining with the Internet of Things to achieve condition monitoring and remote maintenance, while expanding applications in energy-efficient buildings and green infrastructure. In terms of demand and business opportunities, with the increasing global building energy efficiency standards and the growing demand for upgrading aging pipe networks, the brass air vent valve market maintains steady growth and has continued development potential against the backdrop of urbanization and

HVAC upgrades in emerging markets.

Brass Exhaust Valves, as fundamental functional components in HVAC and fluid transport systems, exhibit a market characterized by 'steady growth and strong essential demand,' with demand closely linked to the development of the construction industry, infrastructure construction, and energy-saving renovations. Currently, the core driving force in the global market primarily stems from the widespread adoption of underfloor heating and central air conditioning systems in residential and commercial buildings, as well as the upgrading and renovation of aging heating and water supply networks. These scenarios demand high system stability and operational efficiency, making air vents an indispensable standard component. Meanwhile, in mature markets such as Europe and North America, demand is primarily driven by maintenance replacements and energy-saving upgrades, while in emerging markets like Asia, the Middle East, and Latin America, new construction and urbanization continue to fuel incremental demand.

From a competitive perspective, Brass Exhaust Valves are a relatively mature and standardized product with low industry concentration. Price competition is fierce in the low-to-mid-end market, but in the high-end sector, products with high sealing performance, long lifespan, and corrosion resistance still offer significant added value. With rising building energy efficiency standards and the advancement of smart building trends, the market is demanding higher product performance, such as low leakage rates, maintenance-free design, and compatibility with intelligent control systems. This will drive the industry towards higher quality and differentiation.

Looking ahead, while the brass exhaust valve market is unlikely to experience explosive growth, it possesses a stable long-term demand base. On one hand, global green building and energy-saving renovation policies will continue to release existing market demand; on the other hand, product upgrades, such as the replacement of lead-free environmentally friendly materials and intelligent monitoring exhaust valves, also provide new growth points for the industry. Therefore, this market is a typical 'existing market optimization + incremental market supplementation' market, suitable for companies with cost control and channel capabilities to continue to cultivate, while structural opportunities still exist in high-end niche markets.
