Brazing is a metal-joining process in which two or more metal items are joined by melting and flowing a filler metal into the joint, with the filler metal having a lower melting point than the adjoining metal.

Brazing material refers to the filler metals added in or next to the gap to achieve the combination of two materials.

Brazing flux is the agent used for cleaning, flowing, or purifying. Their function can vary but are an essential component in brazing. Essentially, fluxes remove oxides and other contaminants in order to create solid, high quality brazed joints.
