A breast deboner is a specialized tool or machine used in food processing, particularly in the poultry industry, to remove the bones from chicken breasts. This tool is designed to efficiently separate the bone from the meat, resulting in boneless breast fillets that are ready for further processing or sale. The use of a breast deboner can improve food safety by reducing the risk of bone fragments in the meat, and it can also enhance the eating experience for consumers who prefer boneless chicken. Additionally, deboning chicken breasts can increase the yield of usable meat, as less meat is wasted on the bones during processing.
