The report requires updating with new data and is sent in 48 hours after order is placed.

Breast Milk Collectors are devices used to suction milk from the breasts of lactating mothers and store it in a container to provide a continuous supply of breast milk for feeding their infants as and when required. For instance, when the mothers are not able to feed directly or are away for work, the stored milk can be fed to the infant by the caretakers. Breast Milk Collectors assist in triggering the milk ejection response from lactating mothers by creating a seal around the nipple and applying and releasing pressure.
