The global Breathable Explosion-proof Valve market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Breathable explosion-proof valve is a safety device in equipment or systems, mainly used to prevent explosion or rupture caused by excessive internal pressure. This kind of valve usually has the dual functions of breathability and explosion-proof, and can automatically open when the pressure is too high to release the internal pressure, thereby protecting the safety of the equipment or system.

The working principle of breathable explosion-proof valve is usually to trigger the opening or closing of the valve through changes in internal pressure. When the internal pressure reaches a certain value, the valve will automatically open and release the pressure to avoid damage to the equipment or system. This kind of valve usually has better sealing performance and pressure resistance, and can withstand higher pressure and temperature.
