The roots of artificial breathing can be traced back to World War II when pilots faced challenges in breathing at high altitudes. Similarly, in places where oxygen content is low or during underwater dives, artificial breathing is used to facilitate adequate oxygen supply with the help of breathing equipment. Such equipment, also known as respiratory protective equipment (RPE), is used for safety from harmful substances in certain workplaces and confined spaces. Breathing equipment filters air to remove harmful substances where it detects an oxygen deficiency. Breathing equipment is commonly used at instances where there is a possibility of exposure to fire, harmful chemicals and biological hazards; it is also used in adventure sports and at hospitals. For people in a situation of risk, breathing equipment is often used as a control measure. About a decade ago, breathing equipment was primarily used at hospitals to facilitate spontaneous breathing, but currently it is commonly used at an industrial level and in several other applications.
