A bridge clarifier is a type of mechanical sedimentation system used primarily in rectangular settling tanks at municipal and industrial water or wastewater treatment facilities. It features a fixed or moving bridge-like structure that spans the width of the tank and supports essential components such as a sludge scraping mechanism, surface skimmer, and drive system. In operation, water flows slowly through the tank, allowing suspended solids to settle at the bottom. The bridge clarifier's scraper assembly, either continuously or intermittently, moves along the tank to collect and direct settled sludge toward a sludge hopper for removal, while surface skimmers guide floating materials like grease or scum to a separate trough. Depending on design, the bridge can be stationary (with only the scraper mechanism moving) or traveling (with the entire bridge moving longitudinally). Bridge clarifiers are widely used due to their efficient solid-liquid separation, low energy consumption, and ability to handle large flow rates, making them a critical component in primary and secondary clarifiers of treatment plants.

United States market for Bridge Clarifier is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
