The brine tank is the part of the water softener system that stores the salt and water mixture used to refresh the resin.The water level should always be slightly lower than salt level in the water softener brine tank. This is because the water needs to touch the salt so that it can absorb it and create the correct concentration of brine.

There is a growing emphasis on sustainability and green building practices in the construction industry. Buildings are being designed and constructed to be energy-efficient, environmentally friendly, and to minimize carbon footprint. This trend is driven by environmental concerns, government regulations, and the desire to reduce operating costs through energy savings. The adoption of digital technologies and Building Information Modeling (BIM) is transforming the way buildings are designed, constructed, and managed. BIM enables better collaboration, improved project coordination, and enhanced visualization, resulting in increased efficiency and reduced costs. The integration of technologies such as Internet of Things (IoT), artificial intelligence (AI), and data analytics is further driving the digitization of the building industry. There is a growing focus on creating buildings that promote occupant wellness and well-being. Biophilic design principles are being incorporated, which emphasize connections with nature, natural light, green spaces, and indoor air quality. This trend is driven by increasing awareness of the impact of the indoor environment on people's health, productivity, and overall satisfaction. Climate change and the increased frequency of extreme weather events have heightened the need for resilient and disaster-resistant construction practices. Building codes and regulations are evolving to ensure that buildings can withstand seismic activity, hurricanes, floods, and other natural disasters.
