Abstracts

The global Broadband Aggregation Service market size is predicted to grow from US\$ 1353 million in 2025 to US\$ 2344 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

Broadband Aggregation Service refers to a type of basic network service in telecommunications networks that uses dedicated network equipment and software platforms (such as BNG/BRAS/vBNG) to centrally access, manage, authenticate, bill, and schedule broadband traffic from a large number of access-side users (such as FTTH, DSL, FWA, Wi-Fi, etc.). It is a core control and aggregation node function in fixed broadband networks.

Gross Margin Levels

The broadband aggregation service industry as a whole exhibits medium-to-high gross margins and distinct stratification. Looking at the value distribution across the industry chain, traditional BNG/BRAS equipment and basic delivery services, primarily based on dedicated hardware, typically have relatively stable but not excessively high gross margins. However, when the product form upgrades to 'complete equipment + control plane software + cloud deployment + operation and maintenance subscription services,' profitability significantly improves. Publicly available comparable company data shows that Cisco's GAAP gross margin in the fourth quarter of fiscal year 2025 was 65.7%, indicating that the broadband aggregation sector does not simply rely on low-margin hardware shipments, but increasingly depends on software capabilities, network automation, cloud-native features, and recurring service revenue to boost profit levels. Based on industry realities, I'm more inclined to conclude that the gross profit margin for basic hardware/integration projects is roughly 30%-40%, while integrated hardware and

software solutions typically reach 35%-50%. Vendors focusing on vBNG, OpenBNG, control plane software, operation and maintenance orchestration platforms, and subscription services are expected to see their overall gross profit margin rise to 45%-60% or even higher. Overall, the industry's profit logic is gradually shifting from 'selling equipment' to 'selling platforms, selling software, and selling continuous operational capabilities.'

Industry Drivers

The growth of the broadband aggregation service industry is primarily driven by the expansion of fixed broadband user base, increased fiber optic deployment and FWA penetration, and the upgrade of network architecture towards virtualization and openness. As operators continue to advance the construction of FTTH, gigabit broadband, campus access, and fixed wireless access (FWA), the number of user sessions, access bandwidth, and policy control complexity are rising simultaneously. Traditional centralized BNG/BRAS architectures face expansion pressure, thereby accelerating the deployment of higher-performance, more flexible vBNG, CUPS, distributed BNG, and OpenBNG solutions. Of particular note is Dell'Oro research, which projects a 31% CAGR for the global vBNG platform market from 2025 to 2030. This indicates that industry growth is no longer simply about increasing user numbers, but has entered a new phase driven by architecture replacement: operators want to support more broadband connections and more service types, while also reducing CAPEX and OPEX through hardware-software decoupling, user plane decentralization, cloud-native orchestration, and white-box deployment. In summary, the key drivers of continued industry growth in the coming years will primarily come from the ongoing upgrades to broadband access, the expansion of fixed-mobile convergence services, network cloudification transformation, and operators' long-term demand for highly scalable, low-cost broadband edge architectures.
