Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Browning Solution for PCB market.

Browning solution is a treatment solution to improve the bonding force between the copper surface of the inner layer of the multilayer printed circuit of the printed circuit board and the polymer material. To improve the bonding force between the multilayer boards, two factors can be started: one is to improve the bonding surface The specific surface area, the second is to form a layer of organic metal conversion film. After the inner layer board is browned, a uniform honeycomb-shaped organic metal copper layer is formed on the copper surface. This structure can enhance the bonding force with the semi-cured resin; at the same time, it is important to participate in the resin curing during the lamination process The cross-linking reaction forms a chemical bond, which

further enhances the bonding force with the semi-cured resin. Browning can prevent further corrosion of copper, protect copper lines, improve acid resistance, and ensure the quality and performance of PCB multilayer boards.
