The global Brushed DC Motors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Brushed DC motors have wound coils in the rotor, which are surrounded by magnets contained in the stator. The two ends of a coil are connected to the commutator. The commutator in turn connects to electrodes called brushes, resulting in the flow of direct current electric power through the brushes and coil for as long as the brushes and commutator are in contact.

As the coil rotates, however, it reaches a position where the brushes and commutator are no longer in contact, halting current flow in the coil. Despite this, the momentum of the coil causes it to continue rotating. This brings the brushes and commutator back into contact, restoring the current that now flows through a different coil.

This repeated switching of current flow causes the brushed DC motor to continue rotating. Brushed DC motors operate on direct current, and their speed can be easily controlled by altering the applied voltage.
