In cosmetics, buffers and neutralizers are chemicals used to adjust the acid-base properties of products. They can affect the pH value of the product to keep it in the skin-friendly range, providing better application experience and stability.

Buffering Agents are used to maintain the acid-base balance of the product and prevent the pH from being too high or too low. They can absorb or release hydrogen ions (H<sup>+</sup>) to slow down changes in pH. The choice of buffer usually depends on the specific formulation of the product and the desired pH range.

Neutralizing Agents are used to neutralize acidic or alkaline ingredients to adjust the overall pH of the product. When the product contains acidic or alkaline active ingredients, the neutralizer can neutralize them to neutral to ensure the mildness and safety of the product.

Buffers and neutralizers are used in cosmetics to ensure product stability, efficacy and safety. They can adjust the pH value of the product to adapt to the pH of the skin to avoid irritation or adverse reactions
