According to our LPI (LP Information) latest study, the global Building Energy Software market size was valued at US\$ million in 2023. With growing demand in downstream market, the Building Energy Software is forecast to a readjusted size of US\$ million by 2030 with a CAGR of % during review period.

The research report highlights the growth potential of the global Building Energy Software market. Building Energy Software are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Building Energy Software. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Building Energy Software market.

Building Energy Management Systems (BEMS) are deployed in buildings for efficient energy performance. These systems control and manage building facilities such as lighting, electricity, fire precautions, safety, security, and heating, ventilation and air-conditioning. They are installed in buildings such as commercial buildings, IT parks, hotels, restaurants, manufacturing plants, retail outlets, and residential buildings for effective facility management.

The prospect Building Energy Software can offer for energy savings is mostly unexploited today as several building owners and operators are unaware of how the data driven optimizations can diminish energy consumption. The most energy consuming areas in the building are HVAC systems, office equipment, catering, fan,

pumps and controls. The energy consumption in building facilities, which encompasses mainly the use of fossil fuels, adds to air pollution with adverse impacts on public health and also damages the environment. Carbon dioxide emissions from fossil fuels cause global warming and eventually climate change. Other damaging emissions include oxides of sulphur and nitrogen which cause acid rain. The main benefits that are incurred by BEMS are cost saving, reduction in fossil fuel consumption, balanced environment and exemption from stringent regulation and tax benefits.
