The bull-head full-servo manipulator is a high-speed, high-precision automatic removal device designed for large injection molding machines (generally over 400 tons). Its name comes from its unique 'bull-head' structure: the upper and lower arms and the horizontal structure are arranged at the front end of the main beam, the two arms are driven independently, the motor is placed on the top, and the cable is built-in, with a forward extension shape similar to the appearance of a bull's head. Compared with traditional single-arm or double-section manipulators, this structure has greater rigidity, more stable inertia control, and longer effective vertical travel, and is particularly suitable for automatic removal scenarios of deep-cavity, heavy-load, and multi-cavity complex mold products.

United States market for Bull Head Full Servo Manipulator is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
