Bunionectomy indicates surgical removal of bunion i.e. enlargement of a bony bump at the base of the big toe. A bunion is comprised of soft tissue and bone and causes inflammation in the foot. This bunion causes difficulty in walking and irritation from shoes that don't fit properly.

Bunionectomy is performed when the anti-inflammatory drugs and orthotics are not successful. Recovery from bunionectomy can be done within six to eight weeks and with the help of surgical boot and the patient can walk normally.

Development of bunion can be hereditary or result of congenital deformity. Bunionectomy market is estimated to grow significantly during the forecast period with an increased investment towards the healthcare sector by several developed and developing countries. According to the National Institutes of Health (NIH), the bunion is

likely to appear among 23 out of 100 adults across the globe.

Prevalence of COVID 19 has led to the cancellation of majority non-fatal procedures, hence leading to a delay in global bunionectomy market growth. There has been a significant delay in hospital-patient visits hindering the growth of the global bunionectomy market.
