Bupropion tablets are a type of antidepressant medication primarily used to treat major depressive disorder (MDD) and to support smoking cessation efforts. Bupropion works by inhibiting the reuptake of dopamine and norepinephrine. This unique mechanism makes it distinct from traditional selective serotonin reuptake inhibitors (SSRIs) and can be especially helpful for individuals experiencing symptoms such as low energy, concentration issues, and anhedonia (inability to feel pleasure). Bupropion tablets come in immediate-release, and extended-release (XL) forms to accommodate different dosing needs, with extended-release versions often used to reduce dosing frequency and maintain steady levels in the bloodstream.
