Suspended beds are also called air flow beds. Its principle is to use heated, pressurized and filtered air to blow up the microsphere sand sealed in the bed, and use the upward buoyancy of the sand and air to lift the patient. The patient lies on an ultra-fine sheet with a pore diameter of only 25 microns. The 'mattress' is mixed with antibacterial ceramic particles in a suspended state with a diameter of only 100 microns. There is airflow passing through it, making the patient appear to be in a suspended state. The pressure on the skin on the back reaches Minimum.

The burn suspension bed is one of the advanced medical devices for burn patients. There is no direct contact between the user's body and the bed surface. Even if 95% of the body is severely burned, the patient can ensure that the wound is not compressed

without turning over. The use of suspended beds can not only relieve the pain of burn patients, but also greatly shorten the wound healing time.
