A burn-wet gas abatement system is a specialized technical device designed to handle emissions from combustion processes involving wet gases. It employs physical, chemical, or thermodynamic methods to remove or transform gases such as moisture, wet gases, particulates, or active organic compounds, ensuring that the emissions meet environmental standards. Compared to heat-wet gas abatement systems, burn-wet gas abatement systems are primarily designed to handle high-temperature, high-humidity gases generated during combustion reactions. They need to address higher thermal consumption and complex chemical compositions, often integrating more corrosion-resistant materials and efficient insulation technologies. In contrast, heat-wet gas abatement systems focus more on the management and control of moisture during low-temperature heating processes, with relatively milder treatment conditions.

The significance and purpose of burn-wet gas abatement systems are to effectively control pollution emissions from combustion, protect the environment, improve combustion efficiency, and extend equipment lifespan. The main advantages include significantly reducing harmful emissions, minimizing environmental pollution, optimizing energy utilization efficiency, and reducing the risk of equipment corrosion. In terms of functionality, the system typically integrates modules for dehumidification, filtration,

chemical absorption, or catalytic conversion, capable of efficiently capturing moisture, ensuring stable operation, and adapting to the characteristics of gases in high-humidity, high-temperature, and complex chemical environments, providing reliable support for sustainable operation.
