The global Bus Battery Cooling Systems market size is predicted to grow from US\$ 894 million in 2025 to US\$ 1863 million in 2032; it is expected to grow at a CAGR of 11.3% from 2026 to 2032.

The bus battery cooling system is a thermal management solution designed specifically for electric buses, which aims to keep the battery pack within the optimal operating temperature range to ensure its efficient and safe operation. Since buses usually need to run continuously for a long time and work in an urban environment with frequent starts and stops, the heat generated by their batteries is relatively large, so the cooling system is particularly important. Such systems can use liquid cooling, forced air cooling, or a combination of the two to effectively dissipate heat and prevent battery overheating, thereby extending the battery life and ensuring the reliability of the vehicle and the safety of passengers.

The development trend of bus battery cooling systems in the future will focus more on energy efficiency and intelligent management, and strive to improve the reliability and maintenance convenience of the system. On the one hand, as the requirements for environmental protection and operational efficiency of urban public transportation continue to increase, it is necessary to develop more energy-saving and efficient cooling technologies, such as using waste heat recovery mechanisms or improving the heat exchange efficiency of cooling media to reduce energy consumption and improve overall energy efficiency. On the other hand, with the help of the Internet of Things (IoT) and big data analysis technology, future cooling systems will have real-time monitoring and self-diagnosis functions, and can automatically adjust cooling strategies according to actual operating data, predict potential failures and perform preventive maintenance, thereby improving system reliability and maintenance efficiency. In addition, considering

the special operating environment and load requirements of buses, the design of the cooling system will also pay more attention to durability and adaptability to ensure stable operation under various climatic conditions. These advances not only improve the performance and safety of electric buses, but also provide strong support for the sustainable development of the public transportation sector.
