The global Business Card Digitization Software market size is predicted to grow from US\$ 97 million in 2025 to US\$ 151 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Business Card Digitization Software is an efficiency tool designed specifically for business scenarios. Its core function is to automatically recognize and extract text information from paper business cards using a smartphone camera or a connected business card reader, converting it into structured digital contact data. This software typically integrates optical character recognition (OCR) and artificial intelligence natural language processing technologies, intelligently distinguishing fields such as name, job title, company, phone number, and email address, and automatically categorizing and saving them. It effectively solves the problems of easily lost and difficult-to-manage paper business cards, and can synchronize with mobile phone contacts and customer relationship management systems, enabling efficient management and precise discovery of business contacts. It is an important component of modern digital business workflows.

The global development of Business Card Digitization Software exhibits significant regional differences. The North American and European markets are the most mature, with strong corporate willingness to pay. Products are deeply integrated into CRM systems like Salesforce and are evolving towards AI-driven intelligence analytics. The Asia-Pacific region is experiencing rapid growth, with countries like China, Japan, and South Korea being the core demand centers due to their deep-rooted business card culture. Local products hold an advantage in mobile experience and localized integration. Emerging markets such as Latin America and Southeast Asia are in their early stages, primarily offering free basic applications, limited by the level of digital

penetration. Overall, this market is evolving from basic identification tools to global intelligent business intelligence platforms.
