C4 Full Hydrogenation Catalyst is a petrochemical catalyst used for deep hydrogenation saturation of mixed C4 fractions. The product usually uses palladium-based precious metals or nickel-based non-precious metals as active components, supported on alumina and other carriers. Its main function is to hydrogenate unsaturated components in C4 streams, such as butene, isobutene, butadiene and alkynes, into saturated hydrocarbons such as butane and isobutane as completely as possible, thereby reducing the content of unsaturated hydrocarbons, improving material stability, and lowering the risks of polymerization, coking, storage and transportation instability.

The upstream of C4 Full Hydrogenation Catalyst mainly includes palladium, nickel salts, alumina carriers, promoters, binders and forming materials. The midstream involves catalyst formulation design, active component loading, forming, calcination, reduction or sulfiding activation, and performance evaluation. The downstream is mainly used for full hydrogenation saturation treatment of C4 fractions, serving LPG blending, recycled cracking feedstock, alkane dehydrogenation feedstock preparation, and n-butane/isobutane chemical utilization.
