CAG-FFR measurement refers to the assessment of fractional flow reserve (FFR) during coronary angiography (CAG). It involves using a pressure-sensing guidewire to measure blood pressure before and after a stenosis under conditions of maximal hyperemia. The resulting FFR value quantifies the functional severity of the lesion, helping to determine whether a coronary intervention such as stent placement is warranted. By combining anatomical imaging and physiological evaluation, CAG-FFR enhances diagnostic precision and optimizes PCI decision-making.
