Calcitonin injection is a medication used to treat bone diseases such as osteoporosis, Paget's disease, and hypercalcemia. It works by slowing down the breakdown of bone and increasing bone density. This can help prevent bone fractures and reduce bone pain.

Calcitonin is a natural hormone produced by the thyroid gland. The injectable form of calcitonin is derived from the salmon fish and is available as a prescription medication.

The injection is typically given by a healthcare professional and may be administered daily or several times a week, depending on the individual's condition and response to treatment.

Common side effects of calcitonin injection may include nausea, vomiting, diarrhea, and skin flushing. In some cases, allergic reactions and injection site reactions may occur.

It is important to discuss the potential risks and benefits of calcitonin injection with a healthcare provider before starting treatment. Additionally, patients should inform their healthcare provider of any other medications or supplements they are taking, as they may interact with calcitonin. Regular monitoring and follow-up appointments may be necessary to ensure the medication is effective and well-tolerated.
