## Abstracts

The global Calcium Chloride Hexahydrate market size is predicted to grow from US\$ 376 million in 2025 to US\$ 538 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Calcium Chloride Hexahydrate is a hydrated inorganic salt formed by reacting calcium carbonate (limestone) or calcium hydroxide with hydrochloric acid, followed by crystallization under controlled temperature to obtain the hexahydrate form. It appears as colorless crystalline solids with high hygroscopicity and strong exothermic dissolution properties, widely used in deicing, dust control, oil & gas drilling fluids, refrigeration brines, concrete acceleration, food processing (firming agent), and chemical drying applications. The supply chain begins upstream with limestone mining and chlor-alkali-derived hydrochloric acid production; midstream processing includes neutralization, purification, concentration, evaporation, crystallization, drying, and packaging; downstream distribution flows to infrastructure contractors (road deicing), oilfield service companies (brine fluids), construction material suppliers, food-grade chemical distributors, and industrial moisture-control markets. Major producing regions include North America, China, and Europe, where integrated chlor-alkali producers and specialty chemical manufacturers operate dedicated calcium chloride production lines tied to broader hydrochloric acid value chains. In 2025, global Calcium Chloride Hexahydrate output was about 1.6 million tons against 2.2 million tons of capacity, with prices at USD 210–370 per ton and average gross margins near 18%.
