Abstracts

The global Calcium Fluoride Plano-Convex Lens market size is predicted to grow from US$ 42.98 million in 2025 to US$ 71.93 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

In 2024, the global production of Calcium Fluoride Plano-Convex Lens was approximately 146,000 units, with an average selling price of about US$280 per unit. Single-line capacity was approximately 7,800 units per year, with an average gross profit margin of about 30-40%. Calcium Fluoride Plano-Convex Lens is an optical element made of calcium fluoride material, with one side being flat and the other a convex curved surface. This type of lens has a positive focal length, enabling it to converge light, and is commonly used to focus parallel light into a point or collimate a point source into a parallel beam. Its main advantages include a wide spectral transmission range (180nm-8.0?m) and excellent performance in the ultraviolet to mid-infrared band.

The upstream core encompasses raw materials for synthesizing calcium fluoride crystals, rare earth fluoride dopants, high-purity graphite molds for lens blank forming, optical polishing materials, and antireflective coating targets. Downstream applications are mainly concentrated in astronomical and photographic equipment (such as astronomical telescopes and professional infrared lenses), laser equipment (such as resonant cavities and focusing systems for high-power lasers), and microscopes.

United States market for Calcium Fluoride Plano-Convex Lens is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
