Calcium glucoheptonate is a water-soluble calcium salt of glucoheptonic acid used as a calcium source and chelating/complexing ingredient, produced midstream by fermentative or chemical routes to glucoheptonic acid (from upstream glucose/dextrose and oxidation/bioprocess inputs) followed by neutralization with calcium hydroxide/carbonate, then supplied downstream to applications such as pharmaceuticals and medical products (electrolyte/calcium replenishment), food and beverages (mineral fortification where permitted), and industrial uses like water treatment/cleaning formulations where calcium delivery and metal-ion control are needed.

In 2025, global Calcium Glucoheptonate production reached approximately 78.9 MT, with an average global market price of around US\$ 477.5 per kg. The global single-line production capacity ranges from 20 to 30 MT per year. The industry's gross profit margin is approximately 20%-25%.
