The global Calcium Phosphite Fertilizer market size is predicted to grow from US\$ 607 million in 2025 to US\$ 1029 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

Calcium phosphite fertilizer is a specialized phosphorus-based input in which phosphorus is present in the phosphite (PO_3^{3-}) form rather than phosphate, combined with calcium to deliver both a secondary nutrient and a bioactive phosphorus source; it is widely used in horticulture, fruit trees, vegetables, and turf to improve phosphorus uptake efficiency, stimulate root development, enhance stress tolerance, and suppress certain soil- and foliar-borne pathogens such as *Phytophthora* through induced plant defense responses. Its supply chain starts upstream with phosphorus chemistry feedstocks (phosphorous acid or phosphite salts derived from elemental phosphorus) and calcium sources such as calcium carbonate, calcium hydroxide, or calcium chloride, followed by controlled neutralization and formulation to produce liquid or soluble solid calcium phosphite products; midstream players include specialty fertilizer manufacturers that handle formulation optimization, chelation, stabilization, and packaging; downstream, products are distributed via agrochemical distributors, crop input retailers, and direct-to-farm channels, and are applied by growers through fertigation, foliar spraying, or soil drench systems in high-value crop production. In 2025, the global calcium phosphite fertilizer market records an annual production volume of approximately 310,000 tons against an installed production capacity of around 380,000 tons per year, with average unit prices typically ranging from USD 1,700 to 2,900 per ton, while leading manufacturers and formulators achieve gross margins of about 36%.
