Abstracts

The global Calibrating-Honing Machine market size is predicted to grow from US$ 86.09 million in 2025 to US$ 123 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

In 2024, the global sales volume of calibration-honing machines will be approximately 2,500 units, with an average price of approximately US$33,500 per unit, and the industry's average gross profit margin is around 28%. The calibration-honing machine is a high-precision equipment specially used in the stone processing link. It mainly uses diamond grinding heads or resin grinding heads to grind marble, granite, artificial stone and other slabs to a fixed thickness, so that their thickness is uniform and the surface is flat, providing a stable substrate for subsequent polishing, cutting and assembly processes. This type of equipment usually has the characteristics of multi-grinding head linkage, high automation and digital control, which can significantly improve the consistency and production efficiency of stone products. Its market demand is driven by the expansion of stone applications in architectural decoration, countertop panels, and public facilities. At the same time, the trend of green energy saving and low consumption has accelerated the replacement. The upstream process involves raw materials such as diamond abrasives, servo drive motors, CNC systems, and steel frames. The CNC systems and motors together account for over 60% of the total machine cost. The downstream market includes stone processing plants, architectural decoration projects, and artificial stone manufacturers. LONGINOTTI GROUP has an annual production capacity of approximately 220 units, primarily targeting high-end markets in Europe and the Middle East. In a typical application scenario, large stone mills typically deploy 6-7 units. Multi-head machines (2-6 heads) process 15-40 square meters per hour, while single-head models process 5-10 square meters per hour. Water consumption per unit can reach up to 30 cubic meters per hour. High-end artificial stone

production lines typically utilize five or more units to ensure continuous and stable production.
