Calibration Block is a steel block for the calibration of ultrasonic flaw detection equipment used in material testing. Used for the calibration of shear and longitudinal transducers, determination of shear wave emission point, refracted angle. Also for measurement of sensitivity and resolution.

The calibration block market is experiencing a steady growth trend. Calibration blocks are reference or calibration standards used in non-destructive testing (NDT) and other measurement applications to ensure the accuracy and reliability of test equipment and techniques. These blocks are typically made of materials with known dimensions, shapes, and properties. One of the main factors driving the market trend is the increasing demand for accurate and precise measurements across various industries. Calibration blocks are crucial in maintaining the reliability and traceability of measurement results in fields such as NDT, ultrasonic testing, dimensional inspection, and material testing. Industries such as aerospace, automotive, manufacturing, and oil and gas have strict quality control standards that require regular calibration and verification of testing equipment, resulting in a consistent demand for calibration blocks.
