Calretinin polyclonal antibodies are a mixture of multiple specific antibodies produced by multiple B lymphocyte clones after the body is stimulated by multiple antigenic determinants. These antibodies can specifically bind to calretinin, thus playing an important role in biological research, disease diagnosis and treatment. Calretinin polyclonal antibodies can specifically recognize and bind to calretinin, and this specificity makes it highly accurate and reliable in detecting and analyzing calretinin levels. Calretinin polyclonal antibodies are usually prepared by immunizing animals (such as rabbits). Purified calretinin is injected into animals as an immunogen to stimulate their immune system to produce specific antibodies against the antigen. After a period of immune response, calretinin polyclonal antibodies are separated and purified from the animal serum.

The global Calretinin pAb market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
