Cam roller bearings, also known as cam followers or track followers, are specialized rolling bearings designed to follow cam profiles and transmit motion in a linear or oscillating manner. They typically consist of an outer ring, a stud or shaft attachment, a rolling element (such as a needle roller or cylindrical roller), and a thick-walled outer ring or outer raceway. The outer ring is often crowned or profiled to match the contour of the cam track, allowing the bearing to smoothly track along the cam surface. Cam roller bearings are commonly used in applications where there is reciprocating or oscillating motion, such as in cam-driven mechanisms, indexing systems, conveyor systems, and linear motion guides. They are preferred for their ability to handle high radial loads, moderate to low speeds, and misalignment, making them suitable for a wide range of industrial and machinery applications. Cam roller bearings are available in various configurations, including stud type, yoke type, and eccentric stud, to accommodate different mounting and operating requirements.

The global Cam Roller Bearing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
