The lubrication is effected by the sliding material itself, The solid lubricant is released from the friction material by micro-movement. This gives the sliding partners smooth surfaces with a firmly adhesive solid lubricant film, the solid lubricant film remains within the contact area even under heavy loads. The embedded solid lubricant plugs can be continuously provided to the friction surface to reduce friction resistance and wear, thus make the bearing can be worked under low wear rate and long-life service.

The demand for automation is on the rise across various industries, including manufacturing, automotive, electronics, and packaging. Cam slide units are commonly used in automated assembly lines, material handling systems, and production machinery due to their accuracy and repeatability. As industries continue to adopt automation to improve productivity and efficiency, the demand for cam slide units is expected to increase. Continuous advancements in cam mechanism technology, including the use of high-quality materials and improved design principles, are driving the market growth of cam slide units. These advancements result in enhanced precision, durability, and smoother operation of the cam slide units. There is a growing demand for compact and lightweight linear motion solutions in various industries. Cam slide units offer a compact and space-saving design, making them ideal for applications with limited space or weight constraints. As industries strive to optimize the use of space and reduce machine weight, the demand for compact and lightweight cam slide units is expected to rise.
