The global Camera for EUV market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The advent of fast, affordable, high-power lasers has driven advances in areas such as soft X-ray and EUV imaging, plyometrics, spectroscopy, and tomography. Coupled with increasing investments in industrial EUV lithography and semiconductor metrology processes, the need for fast, high-resolution, and sensitive detectors in the 20 eV to 10 keV range continues to increase. CCDs have long been the technology of choice for direct EUV and X-ray imaging, as well as some scattering applications. sCMOS technology has finally been introduced to enable faster, lower-noise solutions to meet market demands for global semiconductor manufacturing, brighter, faster laser sources, and next-generation synchrotron upgrades. Scientific cameras based on CCDs, or sCMOS, are sensitive to wavelengths from EUV to soft X-rays. It is a direct detector, meaning that soft X-ray and EUV imaging applications can benefit from improved quantum efficiency (QE) when photons are converted directly to charge in the detector silicon layer; as opposed to approaches that use scintillators and indirect detection.

United States market for Camera for EUV is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
