A camera UV filter is a transparent filter that is placed on the front of a camera lens to protect it from scratches, dust, moisture, and other potential damage. Despite the diminishing relevance of UV blocking, some photographers still use UV filters primarily for lens protection. Additionally, UV filters can help reduce haze in certain outdoor conditions, although their effect on image quality is minimal in most cases. Some photographers prefer to leave a UV filter on their lens at all times as a precautionary measure.

The global Camera UV Filter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
