Hearing aid is a small device used by a hearing-impaired person to amplify sound in order to capture it through an ear. Initially, ear devices were designed to gather sound energy in order to pass it into the ear canal. Modern devices are made of computerized electroacoustic systems that help to transform sound in a more intelligible and comfortable way. Audiologists play a vital role in configuring these devices in order to match the frequency with the physical features and lifestyle of the wearer. Hearing aid is not a solution for correction of hearing loss, rather to make the sound accessible to the ear.

One of the primary drivers for this market is the market penetration of digital technologies for hearing aids. With the use of digital technology, the background noise can be eliminated. In some hearing aids, the background noise can be controlled by using volume controller and noise blocker. Furthermore, smartphones have been

integrated with the modern applications for helping hearing impairment patients in leading a normal lifestyle. The digital hearing aids are also equipped more than one listening programs. For instance, Signia Insio Primax 7px IIC is one of the premium, digital technology based canal hearing aid device. Signia has introduced a free mobile application called TouchControl, which is compatible with iPhones and Android devices. With the use of this application, the individual can discreetly control the hearing aids using a smartphone. This technological development in the canal hearing aids market is expected to propel the market growth in the coming years.
